Past performance is not indicative of future performance. The performance data does not take into account the commissions and expenses applied to the issue and redemption of shares. Past performance is shown in the share class currency. **Returns are gross of tax charges**. The fund's performance may be the result of currency fluctuations, either rising or falling. Investors may not recover their entire capital invested. *Data Source: Banca del Sempione SA*

Objective and Strategy

The aim of the Flexible Low Risk Exposure sub-fund is to generate positive real returns for the investor, whilst maintaining particular attention to the preservation of capital.

The active asset allocation process is implemented through a flexible approach on different asset class, mainly government and corporate bonds, equity and Forex. The maximum exposure to high risk securities such as equities and high yield bonds is limited singularly to 15% of total assets.

BASE INVESTMENTS SICAV

FLEXIBLE LOW RISK EXPOSURE - CHF

Monthly Summary

July was marked by a return of volatility across financial markets, driven by renewed geopolitical tensions in the Middle East and growing investor focus on the sustainability of valuations in the technology sector. In fixed income markets, conditions remained challenging. Renewed geopolitical tensions, together with still-resilient macroeconomic data, pushed government bond yields higher across both the short and long ends of the yield curve. Short-term yields continued to reflect monetary policy expectations, while longer maturities were supported by robust growth prospects, particularly in the United States. The 10-year U.S. Treasury yield ended the month at 4.70%, while the 10-year German Bund yield closed at 3.10%. Credit markets remained resilient overall, although spreads widened selectively within the technology sector, where elevated investment in artificial intelligence raised concerns about increased reliance on debt financing. Equity markets continued the sector rotation observed in recent months, with investors reducing exposure to growth stocks in favor of sectors that had previously underperformed. The Nasdaq 100 declined by 6.5% in July, while the S&P 500 (-0.05%), Euro Stoxx 600 (+1.30%), and SMI (+1.10%) posted broadly flat or slightly positive returns. Among commodities, gold consolidated the gains achieved in previous months, holding around USD 4,000 per ounce, while oil recovered to approximately USD 80 per barrel following renewed tensions in the Middle East. Bitcoin, meanwhile, continued to trade within a consolidation range of USD 60,000–65,000.

Positioning and market view

Interest Rates: A particularly challenging month for interest rates. Inflation-linked bonds, in particular, suffered the dual impact of rising nominal yields and falling breakeven, which pushed long-term real yields above 3%. We believe these levels are extremely attractive from a long-term perspective, and we have further increased our exposure, especially to the 15-year yield. While we recognize that this is currently a contrarian position, looking ahead, we believe the conditions are being created for a potential asymmetry of returns, with the downside somewhat limited by carry and valuation levels, and a significant upside should growth and monetary policy expectations reprice.

Credit: We have further reduced credit risk, both due to very tight valuations and to offset increased interest rate risks. We have reduced some emerging market themes that have delivered very positive performances throughout the year. We are watching the bonds of the major hyperscalers with interest, suffering more from high supply than from a worrying deterioration in balance sheet quality; however, we are avoiding lower-quality names in the tech space.

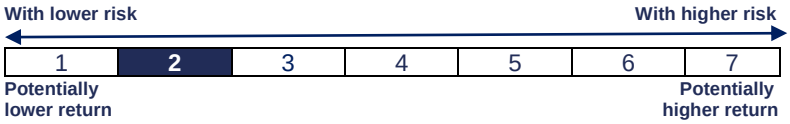
Equity: structural exposure at zero, a tool used occasionally for tactical adjustments.

FX: over the month, we increased our exposure to the yen, which was subsequently rewarded by the joint intervention of the Bank of Japan and the US Treasury. Strategically, we remain short on the dollar, against the euro, the yen, and a basket of secondary currencies.

FLEXIBLE LOW RISK EXPOSURE - CHF

Risk Indicator

Risk Profile



The summary risk indicator assumes you keep the Product until maturity end of the recommended holding period (5 years). The actual risk can vary significantly if you cash in at an early stage and you may get back less. The summary risk indicator is a guide to the level of risk of this Product compared to other products. It shows how likely it is that the Product will lose money because of movements in the markets or because we are not able to pay you. This Product is rated in the category above mentioned, in line with the type of securities and geographic regions detailed under the heading "Objectives and investment policy". The capital is not guaranteed.
The following risks may be materially relevant but may not always be adequately captured by the synthetic risk indicator and may cause additional loss:
Credit Risk: the Product may invest in debt securities which are exposed to the risk that the borrower will be unable to meet its repayment obligations.
Counterparty Risk: the Product may suffer losses if a counterparty to a financial instrument defaults and fails to meet its payment obligations to the Product.
Emerging and Frontiers Markets Risk: increased political or social instability, economies based on only a few industries, unstable currencies, runaway inflation, highly volatile securities markets, unpredictable shifts in policies relating to foreign investments, lack of protection for investors may affect the investments of the Product.
Market Risk: the Product may experience losses from fluctuations in securities prices in portfolio.
Liquidity Risk: when investments are made in financial instruments that could have a lower level of liquidity in some circumstances for example in the case of a market crash or default of issuers and/or due to massive redemptions of shareholders resulting in a potential decrease of the value of certain of the Product's investments.
Interest Rate Risk: interest rate risk is the possibility that the value of the assets of the Product will decline as the result of an unexpected change in interest rates, especially but not limited, for investments in bonds.
Currency Risk: the Product invests in assets priced in foreign currencies which may be adversely affected by changes in exchange rates in relation to the reference currency of the Product and of the share classes denominated in a currency other than the reference currency.
Operational Risk: this is the risk that failures, problems and/or inadequacies of systems, processes and/or people (in particular by the investment manager) may cause losses to the Product.
Risk linked to the use of derivative instruments: a careful use of derivatives can be beneficial to the Product but implies additional risks different from traditional assets such as the risk of divergent valuation depending on the application of different pricing methodologies. The use of derivatives can result in greater fluctuations of the Product assets and may cause the Product to lose as much as or more than the amount invested. Due to the use of derivatives, the Product may have an increased exposure to particular investment known as leverage. A fall in value of such investments can result in a proportionately greater loss to the Product.
Volatility-Leverage: In order to efficiently implement the Sub-Fund's strategy and to achieve the risk target that is consistent with the Sub-Fund's risk profile, the Sub-Fund will rely intensively on financial derivative instruments and underlyings that may generate a high level of leverage and the Sub-Fund may experience higher volatility than a fixed income fund that does not use leverage.
The list of possible risks is not exhaustive; full risk information is available in the Sale Prospectus, chapter 5 "Special consideration on risks".

Glossary

Share class sub-fund of a fund differentiated in terms of client type, fee structure, currency, minimum investment or other characteristics. The characteristics of each share class are described in the offering prospectus. **Management fee** is a fee that covers all costs charged to a fund in relation to portfolio management services and, if applicable, distribution services. **Incentive fee (performance)** is a fee withheld by the management company based exclusively on the results achieved by the fund and is calculated if the fund performs better than a reference index, the benchmark, or if it records a gain in absolute terms. **Duration** indicates the number of years an investor should keep a position in the bond until the present value of the bond's cash flows to equal the amount paid for that bond. Longer is the duration, more the price of a bond will be influenced by changes in interest rates. Duration can also be used to compare the risk of debt securities with maturities and yields. **High Water Mark (HWM)** is the highest value achieved by a fund and it is used as a threshold to measure a manager's performance. In the case of this fund, according to the HWM principle, no performance fee will be charged if the NAV, before considering the fee, is lower than the latest reference NAV. Any losses accumulated in the past can be written off after a period of five years. The performance fee is assessed at the end of each calendar year, following a calculation method described in the prospectus. **Index** is a portfolio that holds a broad range of securities according to predefined rules. Some indices are used to represent the performance of particular markets and therefore serve as a point of reference for measuring the performance of other portfolios. An index used as a reference for performance comparison is called a "benchmark index". **ISIN** (International Securities Identification Number) unique code that identifies a specific financial security. It is assigned by the respective national coding agency of a country. **Bonds** are debt (for the entity that issues them) and credit securities (for the entity that purchases them) that represent a portion of debt taken out by a company or public body for financing. They guarantee the buyer the reimbursement of the capital (at the end of the pre-established period) plus interest (the remuneration that is due to those who purchase bonds in exchange for the sum invested). **High Yield Bonds** are a type of corporate bond that offers a higher interest rate due to its greater risk of default. Credit rating evaluates the ability of a bond issuer to repay all its debt obligations (interest and principal) on time. High ratings, such as AAA or Aaa, indicate low risk (i.e a low probability of default), while ratings such as BBB– or Baa3 indicate greater risk. **Yield to maturity (YTM)** indicates the fund's return if all the bonds in the portfolio were to be held until the maturity date. The ratio is expressed as a percentage annual return. **Volatility**, the fluctuation of a fund's performance over a given period, provides an analysis of the amount of risk and uncertainty in a security or portfolio. Tipically, higher is the volatility, riskier is the securities or portfolio.
